

About Lab 0

Lab 0 has 3 parts, all of which should be easy and useful.

In Part I you log into the Lab machines (King 201 or 135), start up Eclipse, and write a program that we give you the code for. The whole point of this part is how to use the lab machines.

In Part II you install Java and Eclipse on your own laptop, and then write the same ultra-brief program as in Part I. The whole point of Part II is how to do the work for this course on your laptop.

You don't have to do both Part I and Part 2 since they produce the same program. I think you will be happier and have more options when things get busier if you do both parts.

In Part III you write a program to print a triangle out of '*' characters, such as

*

If Java seems scary to you, you might put this off till after Wednesday's class.
